

BITCOIN INVESTMENT COMMITTEE BRIEF

June 30, 2026 Bottom Assessment | Decision-focused summary

Investment question: Does the evidence support treating the June 30, 2026 low as a credible cycle bottom, and what should an investment committee do with crypto exposure while confirmation develops?

CYCLE PEAK	JUNE 30 BOTTOM
\$124.82K	\$58.53K
CYCLE DRAWDOWN	RECOVERY FROM BOTTOM
-53.11%	30.52%

EXECUTIVE DECISION

Recommendation: measured exposure with confirmation.

The research supports treating June 30 as a **credible candidate cycle bottom**, but not as a confirmed cycle bottom. For an investment committee, the evidence supports a staged approach to exposure while preserving capital for confirmation or renewed weakness. The June 30 / \$58.53K level should remain the principal downside reference in this framework.

WHY THE THESIS HAS STRENGTHENED

- **Recovery:** Bitcoin has recovered 30.52% from the June 30 low, a meaningful post-bottom move.
- **Valuation:** MVRV was approximately 1.10 at the June 30 low and is now 1.47, showing a material valuation recovery without returning to extreme late-cycle conditions.
- **Historical recovery:** The current time to +30% recovery is within the broad range observed across prior cycle bottoms.
- **Market structure:** CME open interest and positioning show that market participation has continued to evolve after the low.

WHY CONFIRMATION IS STILL REQUIRED

- **ETF flows remain volatile:** the dashboard's cumulative ETF flow remains approximately -1.61K BTC, while external data shows alternating inflow and outflow periods.
- **Historical valuation is not a perfect match:** prior bottoms frequently occurred at lower MVRV levels, although the 2013 cycle demonstrates that a bottom can occur above 1.0.
- **Current cycle is incomplete:** unlike historical cycles, the eventual outcome of the 2026 cycle is not yet observable.
- **Macro risk remains:** changes in rates, liquidity and risk appetite can overwhelm crypto-specific signals.

MARKET & VALUATION SNAPSHOT

Drawdown: The 53.11% decline is shallower than every historical cycle-bottom drawdown represented in the dashboard dataset: 2011 (92.75%), 2013 (71.24%), 2015 (84.52%), 2018 (83.78%) and 2022 (76.67%). This makes drawdown depth alone insufficient as a bottom-confirmation signal.

Realized price: Current realized price is approximately \$53.19K, placing BTC about 43.61% above realized price in the dashboard model.

Recovery speed: Time to +30% recovery is approximately 52 days for 2026 versus 11 days (2011), 5 (2013), 8 (2015), 108 (2018) and 66 (2022).

Bottom line for the committee: the evidence has moved beyond a simple possible-bottom scenario, but it has not reached a confirmation standard that eliminates material downside risk.

INVESTMENT COMMITTEE BRIEF — DECISION FRAMEWORK

What would strengthen the thesis, what would weaken it, and how to act on the evidence

EVIDENCE MATRIX

Evidence	Current observation	Investment meaning
Price / recovery	30.52% recovery from \$58.53K	Supports a meaningful post-bottom recovery; not sufficient alone.
MVRV	1.47 current; ~1.10 at June 30	Shows valuation recovery from a reset level; not an exact historical bottom match.
Realized price	\$53.19K; BTC ~43.61% above it	Market remains above aggregate realized-cost reference in the model.
ETF flows	-1.61K BTC cumulative in dashboard	Caution signal; demand confirmation remains important.
CME positioning	Speculators positive; commercials negative	Useful context for participation and positioning; not independently predictive.
Drawdown	-53.11% peak-to-bottom	Less severe than prior historical bottoms in dataset.

ACTION FRAMEWORK

Measured exposure: Treat the current evidence as sufficient to justify a controlled/staged exposure framework rather than an all-or-nothing decision.

Confirmation phase: Increase confidence only as recovery persists and independent evidence—especially ETF/spot flows, valuation stability and controlled derivatives positioning—converges.

Risk-control phase: If price loses the June 30 / \$58.53K reference and this is accompanied by deteriorating flows and renewed valuation stress, the bottom thesis should be materially reassessed.

DECISION TRIGGERS

- Signals that would **strengthen** the thesis:
- Sustained recovery above the post-bottom range with continued follow-through.
 - Persistent improvement in spot/ETF capital flows.
 - Stable or constructive MVRV without a rapid return to excessive valuation.
 - Derivatives participation increasing without an unstable leverage build-up.
- Signals that would **weaken** the thesis:
- Sustained break below \$58.53K / June 30 low.
 - Persistent ETF net outflows alongside falling price.
 - Renewed severe MVRV compression and broader on-chain stress.
 - Rising leverage combined with declining spot price.

INVESTMENT COMMITTEE CONCLUSION

June 30 should be treated as a credible candidate cycle bottom, not a confirmed cycle bottom. The current recovery, valuation reset and historical recovery comparisons provide a constructive foundation, while ETF-flow volatility, incomplete cycle evidence and macro risk argue for confirmation and downside controls. The central decision framework is therefore measured exposure with confirmation, with \$58.53K retained as the key invalidation reference.
